#### Abstract

The concepts of quaternion symmetric doubly stochastic are developed, basic theorems and some results for these matrices and characterization are analyzed with examples.

Key words : Doubly stochastic matrix, quaternion symmetric doubly stochastic matrix, quaternion orthogonal symmetric doubly stochastic matrix, centro doubly stochastic matrix.

Subject code classification:15B99, 15A51

\section*{Introduction}

The concepts of quaternion symmetric doubly stochastic matrix are applied ${ }^{1-4}$. In this paper, the quaternion symmetric doubly stochastic matrix is developed in quaternion matrices. Denoted by $A^{T}$ is the transpose of A and A* is the conjugate transpose of A.

\section*{Definition (1) ${ }^{5}$}

Suppose $A=\left(a_{i j}\right)_{n \times n}$ is a doubly stochastic matrix such that, A matrix $A=\left(a_{i j}\right)_{n \times n}$ is called a doubly stochastic matrix if $\sum_{i=1}^{n} a_{i j}=1$ and $\sum_{j=1}^{n} a_{i j}=1$ and all $\mathrm{a}_{\mathrm{ij}} \geq 0$

## 1. QUATERNION SYMMETRIC DOUBLY STOCHASTIC MATRIX.

Definition 1.1
A matrix $\mathrm{A} \in \mathrm{H}^{\mathrm{n} \mathrm{\times n}}$ is said to be quaternion symmetric doubly stochastic if $\mathrm{A}^{\mathrm{T}}=\mathrm{A}$ and $\sum_{i=1}^{n} a_{i j}=1, j=1,2, \ldots . n$ and $\sum_{j=1}^{n} a_{i j}=1, i=1,2, \ldots n$ and all $\mathrm{a}_{\mathrm{ij}} \geq 0$ (or) if A is doubly stochastic and also symmetric then it is called a quaternion symmetric doubly stochastic matrix.

## Theorem 1.1

Let $A$ be a square matrix in $H^{n \times n}$. Then $A$ is quaternion symmetric doubly stochastic iff $A=A^{T}$.
Proof:
Let $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)$ be an $\mathrm{n} \times \mathrm{n}$ matrix. Then $\mathrm{A}^{\mathrm{T}}=\left(\mathrm{b}_{\mathrm{ij}}\right)$ is an $\mathrm{n} \times \mathrm{n}$ matrix. Where $\mathrm{b}_{\mathrm{ij}}=\mathrm{a}_{\mathrm{ji}}$ for all $\mathrm{i}, \mathrm{j}$.
$\Rightarrow$ Let $A$ is quaternion symmetric doubly stochastic. Then $\mathrm{a}_{\mathrm{ij}}=\mathrm{a}_{\mathrm{j} \mathrm{j}}$

$$
\text { for all } \mathrm{i}, \mathrm{j} \text { from the definition, } \mathrm{a}_{\mathrm{ij}}=\mathrm{b}_{\mathrm{ij}} \text { for all } \mathrm{i}, \mathrm{j} \text {. }
$$

Therefore,

$$
\mathrm{A}=\mathrm{A}^{\mathrm{T}} .
$$

Let $\mathrm{A}=\mathrm{A}^{\mathrm{T}}$ (Then $\mathrm{a}_{\mathrm{ij}}=\mathrm{b}_{\mathrm{ij}}$ for all $\mathrm{i}, \mathrm{j}$

$$
\left.=a_{i j} \text { for all } i, j .\right)
$$

$\Rightarrow \mathrm{A}$ is quaternion symmetric doubly stochastic matrix

$$
\begin{aligned}
& \Rightarrow A^{T}=A \text { then } b_{i j}=a_{i j} \text { for all } \mathrm{i}, \mathrm{j} \\
& =b_{\mathrm{ji}} \text { for all } \mathrm{i}, \mathrm{j}
\end{aligned}
$$

$\Rightarrow A^{T}$ is quaternion symmetric doubly stochastic matrix.

## Theorem 1.2:

If $A$ and $B$ are $n \times n$ quaternion symmetric doubly stochastic matrices, then
(1) $1 / 2(A+B)^{T}=1 / 2\left(A^{T}+B^{T}\right)$
(2) $(k A)^{T}=k A^{T}$, where $k$ is scalar are also quaternion symmetric matrices.

Proof:
(1) Let $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)_{\mathrm{n} \mathrm{\times n}}$ and $\mathrm{B}=\left(\mathrm{b}_{\mathrm{ij}}\right)_{\mathrm{n} \mathrm{\times n}}$ be quaternion symmetric doubly stochastic matrices.

Then $1 / 2(A+B)$ is an $n \times n$ quaternion symmetric doubly stochasticmatrix.
Since $A^{T}$ and $B^{T}$ are $n \times n$ quaternion symmetric doubly stochastic matrices then $1 / 2\left(A^{T}+B^{T}\right)$ is also $n \times n$ quaternion symmetric matrix. Thus $1 / 2(A+B)^{T}$ and $1 / 2\left(A^{T}+B^{T}\right)$ are of same type
$(\mathrm{i}, \mathrm{j})^{\text {th }}$ entry of $1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}=(\mathrm{j}, \mathrm{i})^{\text {th }}$ entry of $1 / 2(\mathrm{~A}+\mathrm{B})=1 / 2\left(\mathrm{a}_{\mathrm{ij}}+\mathrm{b}_{\mathrm{ji}}\right)$

$$
\begin{aligned}
& =1 / 2\left\{(\mathrm{j}, \mathrm{i})^{\text {th }} \text { entry of } \mathrm{A}+(\mathrm{j}, \mathrm{i})^{\mathrm{th}} \text { entry of } \mathrm{B}\right\} \\
& =\left\{(\mathrm{i}, \mathrm{j})^{\text {h }} \text { entry of } \mathrm{A}^{\mathrm{T}}+(\mathrm{i}, \mathrm{j})^{\text {th }} \text { entry of } \mathrm{B}\right\} \\
& =1 / 2\left\{(\mathrm{i}, \mathrm{j})^{\text {th }} \text { entry of }\left(\mathrm{A}^{\mathrm{T}}+\mathrm{B}^{\mathrm{T}}\right)\right\} \\
& \Rightarrow 1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}=1 / 2\left(\mathrm{~A}^{\mathrm{T}}+\mathrm{B}^{\mathrm{T}}\right)
\end{aligned}
$$

(2) Let $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)_{\mathrm{n} \times \mathrm{n}}$ quaternion symmetric doubly stochastic matrix then $(\mathrm{kA})_{\mathrm{n} \times \mathrm{n}}$ quaternion symmetric doubly stochastic matrix. wherek is Scalar and hence also $(k A)^{T}{ }_{n \times n}$ quaternion symmetric matrix. Since $\left(A^{T}\right)_{n \times n}$ quaternion symmetric doubly stochastic matrix and also $(k A)$ ) quaternion symmetric matrix. Hence $(k A)^{\mathrm{T}}$ and $\left(k A^{\mathrm{T}}\right)$ are of the same type.
Also $(\mathrm{i}, \mathrm{j})^{\text {th }}$ entry of $(\mathrm{kA})^{\mathrm{T}}=(\mathrm{j}, \mathrm{i})$ entry of $(\mathrm{kA})$
$=\mathrm{k} \mathrm{a} \mathrm{a}_{\mathrm{ij}}$
$=\mathrm{k}(\mathrm{j}, \mathrm{i})^{\mathrm{th}}$ entry of A .
$=\mathrm{k}(\mathrm{i}, \mathrm{j})^{\text {th }}$ entry of $\mathrm{A}^{\mathrm{T}}$
$=(\mathrm{i}, \mathrm{j})^{\mathrm{th}}$ entry of $\mathrm{kA}^{\mathrm{T}}$.
$(k A)^{T}=k A^{T}$, where $k$ is scalar.
Example1.1: To prove $1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}=1 / 2\left(\mathrm{~A}^{\mathrm{T}}+\mathrm{B}^{\mathrm{T}}\right)$.
Let
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{B}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$\mathrm{A}^{\mathrm{T}}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{B}^{\mathrm{T}}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}=1 / 2\left(\mathrm{~A}^{\mathrm{T}}+\mathrm{B}^{\mathrm{T}}\right)=1 / 2(\mathrm{~A}+\mathrm{B})$
$1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}=1 / 2\left(\begin{array}{ccc}2+3 i+3 j & 4-2 i-2 j & -4-i-j \\ 4-2 i-2 j & -9+j & 7+2 i+j \\ -4-i-j & 7+2 i+j & -1-i\end{array}\right)$
$\mathrm{A}+\mathrm{B}=\left(\begin{array}{ccc}2+3 i+3 j & 4-2 i-2 j & -4-i-j \\ 4-2 i-2 j & -9+j & 7+2 i+j \\ -4-i-j & 7+2 i+j & -1-i\end{array}\right)$
$1 / 2(\mathrm{~A}+\mathrm{B})^{\mathrm{T}}$ is an quaternion symmetric doubly stochastic matrices.
Hence proved $1 / 2(A+B)^{T}=1 / 2\left(A^{T}+B^{T}\right)=1 / 2(A+B)$
Property 1.1:
If $\mathrm{A} \in \mathrm{H}^{\mathrm{n} \times \mathrm{n}}$ is quaternion symmetric doubly stochastic matrix then $\mathrm{A}^{\mathrm{n}}$ is also quaternion symmetric doubly stochastic matrix for positive integer n

Proof:
Let $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)$ be an $\mathrm{n} \times \mathrm{n}$ matrix. Then $\mathrm{A}^{\mathrm{n}}=\left(\mathrm{b}_{\mathrm{ji}}\right)$ is an $\mathrm{n} \times \mathrm{n}$ matrix, where $\mathrm{b}_{\mathrm{ij}}=\mathrm{a}_{\mathrm{ij}}$.
for all $\mathrm{i}, \mathrm{j}$.

$$
\Rightarrow \text { : Suppose A is quaternion symmetric doubly stochastic. }
$$

Then $a_{i j}=a_{i j}$ for all $i, j$ from definition

$$
=b_{i j} \text { for all } \mathrm{i}, \mathrm{j} .
$$

Therefore $A=A^{T}$

$$
\Leftarrow: \text { Suppose A = A }{ }^{\mathrm{T}}
$$

Then $\mathrm{a}_{\mathrm{ij}}=\mathrm{b}_{\mathrm{ij}}$ for all $\mathrm{i}, \mathrm{j}$.
$=\mathrm{a}_{\mathrm{ji}}$ for all $\mathrm{i}, \mathrm{j}$.
$\Rightarrow \mathrm{A}$ is quaternion symmetric doubly stochastic matrix.
Example 1.2: quaternion symmetric doubly stochastic matrices.
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{A}^{\mathrm{T}}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{A}=\mathrm{A}^{\mathrm{T}}$
$\Rightarrow \mathrm{A}$ is quaternion symmetric doubly stochastic matrix.
Property 1.2:
Products of any two quaternion symmetric doubly stochastic matrices are not an quaternion symmetric doubly
stochastic matrix if and only if quaternion symmetric doubly stochastic matrix is non - commutative.
Proof:
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{B}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$\mathrm{AB}=\left(\begin{array}{ccc}3+k & -4-i-k & 2 \\ -16+6 i+7 j & 30+7 j & -12-5 i \\ 14+2 i & -20 & 11-i+j\end{array}\right)$
Theorem 1.3:
If $A$ and $B$ are $n \times n q$ uaternion symmetric doubly stochastic matrices then $(A B)^{T} \neq B^{T} A^{T}$ is not a quaternion symmetric doubly stochastic matrix.
Proof:
Let $\mathrm{A}=\left(\mathrm{a}_{\mathrm{ij}}\right)_{\mathrm{n} \times \mathrm{n}}$ and $\mathrm{B}=\left(\mathrm{b}_{\mathrm{ij}}\right)_{\mathrm{n} \times \mathrm{n}}$ quaternion symmetric doubly matrices then $\mathrm{AB}=\left(\mathrm{c}_{\mathrm{ji}}\right)$ is an $\mathrm{n} \times \mathrm{n}$ quaternion symmetric doubly stochastic matrix where, $\mathrm{C}_{\mathrm{ij}}=\sum_{k=1}^{n} a_{i k} b_{k j}$
$\operatorname{Let}(\mathrm{AB})^{\mathrm{T}}=\left(\mathrm{d}_{\mathrm{ij}}\right)$ where $\mathrm{d}_{\mathrm{ij}}=\mathrm{c}_{\mathrm{ji}}=\sum_{k=1}^{n} a_{j k} b_{k i}$ the $(\mathrm{AB})^{\mathrm{T}}{ }_{\mathrm{nxn}}$ quaternion symmetric doubly stochastic matrix.
Let $A^{T}=\left(e_{i j}\right)$ where $e_{i j}=a_{j i}$ and $B^{T}=\left(f_{i j}\right)$ where $f_{i j}=b_{j i i}$. Since $(B)^{T}{ }_{n \times n}$ and $(A)^{T}{ }_{n \times n}$ quaternion symmetric doubly stochastic matrices respectively. Hence $\left(B^{T} A^{T}\right)_{n \times n}$ quaternion symmetric doubly stochastic matrix. Thus (AB) ${ }^{T}$ and $B^{T} A^{T}$ are of same type.
quaternion does not satisfy commute properly.
Let $\mathrm{B}^{\mathrm{T}} \mathrm{A}^{\mathrm{T}}=\left(\mathrm{g}_{\mathrm{ij}}\right)$ where $\mathrm{g}_{\mathrm{ij}}=\sum_{k=1}^{n} f_{i k} e_{k j}$
Also $(\mathrm{i}, \mathrm{j})^{\text {th }}$ entry of $(\mathrm{AB})^{\mathrm{T}}=\mathrm{d}_{\mathrm{ij}}=\sum_{t=1}^{n} A_{t}=\sum_{k=1}^{n} e_{k j} f_{i k} \quad\left[\mathrm{e}_{\mathrm{ij}}=\mathrm{a}_{\mathrm{ij}} \& \mathrm{f}_{\mathrm{ij}}=\mathrm{b}_{\mathrm{ij}}\right]$
$=\sum_{k=1}^{n} f_{i k} e_{k j}=\mathrm{g}_{\mathrm{ij}}=(\mathrm{i}, \mathrm{j})^{\mathrm{th}}$ entry of $\mathrm{B}^{\mathrm{T}} \mathrm{A}^{\mathrm{T}}$. Thus $(\mathrm{AB})^{\mathrm{T}} \neq \mathrm{B}^{\mathrm{T}} \mathrm{A}^{\mathrm{T}}$.
Theorem 1.4:
If $A$ and $B$ are $n \times n$ quaternion symmetric doubly stochastic matrices, then
(1) $1 / 2(A+B)$ is quaternion symmetric doubly stochastic matrix.
(2) $(\mathrm{kA})$ is quaternion symmetric matrix, where K is scalar.
(3) $1 / 2(A B+B A)$ is quaternion symmetric doubly stochastic matrix.
(4) AB is quaternion symmetric doubly stochastic matrix if and only $\mathrm{AB} \neq \mathrm{BA}$.

Proof:
Since $A$ and $B$ are quaternion symmetric doubly stochastic matrices, so $A=A^{T}$ and $B=B^{T}$
(1) $1 / 2(A+B)^{T}=1 / 2\left(A^{T}+B^{T}\right)=1 / 2(A+B)$
$\Rightarrow 1 / 2(A+B)$ is quaternion symmetric doubly stochastic matrix [see Ex:1.1]
(2) $(k A)^{T}=K A^{T}=K A$, where $K$ is scalar.
$\Rightarrow(\mathrm{kA})$ is quaternion symmetric matrix, where K is scalar.
(3) $1 / 2(A B+B A)^{\mathrm{T}}=1 / 2\left((\mathrm{AB})^{\mathrm{T}}+(\mathrm{BA})^{\mathrm{T}}\right)=$ $1 / 2\left(B^{T} A^{T}+A^{T} B^{T}\right)=1 / 2(B A+A B)$ $=1 / 2(A B+B A)$.
$\Rightarrow 1 / 2(A B+B A)$ is quaternion symmetric doubly stochastic matrix. ${ }^{6}$
(4) Suppose $A B$ is not quaternion symmetric doubly stochastic matrix, then $(A B)^{T}=A B$
(i.e,) $(A B)^{T}=A B \Rightarrow B^{T} A^{T}=A B \Rightarrow B A \neq A B$
$A B \neq B A$.
$\Leftarrow$ Suppose $A B \neq B A$, then $(A B)^{T} \neq(B A)^{T}=A^{T} B^{T} \neq A B$ is not an quaternion Symmetric doubly stochastic matrix.
Property 1.3: If $\mathrm{A}, \mathrm{B} \in \mathrm{H}^{\mathrm{nxn}}$ then $(\mathrm{AB})^{\mathrm{n}} \neq \mathrm{A}^{\mathrm{n}} \mathrm{B}^{\mathrm{n}}$ for $\mathrm{n}>1$
Example 1.3:
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{B}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$\mathrm{AB}=\left(\begin{array}{ccc}3+k & -4-i-k & 2 \\ -16+6 i+7 j & 30+7 j & -12-5 i \\ 14+2 i & -20 & 11-i+j\end{array}\right)$
$A^{2}=\left(\begin{array}{ccc}-2 & 6 & 5 \\ 6 & 36 & 23 \\ 5 & 23 & 5\end{array}\right) \mathrm{B}^{2}=\left(\begin{array}{ccc}-4 & 6 & 5 \\ 6 & 8 & 3 \\ 5 & 3 & 1\end{array}\right)$
$\mathrm{AB}^{2}=\left(\begin{array}{ccc}8 & 18 & 4 \\ 171 & 851 & 169 \\ 194 & 400 & 121\end{array}\right)$
$A^{2} B^{2}=\left(\begin{array}{ccc}3 & 51 & 13 \\ 307 & 293 & 161 \\ 143 & 229 & 99\end{array}\right)$
$(A B)^{2} \neq A^{2} B^{2}$.
In general $(A B)^{n} \neq A^{n} B^{n}$.
Let as assume that this is true for $\mathrm{n}-1$
$(\mathrm{AB})^{n-1} \neq A^{n-1} B^{n-1}$
$(\mathrm{AB})^{n}=(A B)^{n-1}(A B)$
$\neq(A B)^{n-1}(B A)$
$\neq B^{n-1}\left(A^{n-1} B\right) A$
$\neq B^{n-1} B A^{n-1} A$
$\neq B^{n} A^{n}$
In general $(\mathrm{AB})^{n-1} \neq A^{n-1} B^{n-1}$ its true for $\mathrm{n}>1$
quaternion symmetric matrices does not satisfy commutative property.
Property 1.4:
If $A, B \in H^{n \times n}$ are quaternion symmetric doubly stochastic matrices then $A+B=2 c$ where $C$ is another quaternion. Symmetric doubly stochastic matrix (or) The sum of symmetric doubly stochastic matrices of same order is twice the quaternion symmetric doubly stochastic matrix. (or) If $\mathrm{A}_{1}, \mathrm{~A}_{2}, \ldots \ldots \mathrm{~A}_{\mathrm{n}} \in \mathrm{H}^{\mathrm{n} \mathrm{\times n}}$, then $\sum_{t=1}^{n} A_{t}$ is quaternion symmetric doubly stochastic matrices multiplied by ' $n$ '
Proof:
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{B}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$\mathrm{A}+\mathrm{B}=\left(\begin{array}{ccc}2+3 i+3 j & 4-2 i-2 j & -4-i-j \\ 4-2 i-2 j & -9+j & 7+2 i+j \\ -4-i-j & 7+2 i+j & -2-i\end{array}\right)$
$\mathrm{A}+\mathrm{B}=\left(\begin{array}{ccc}1+\frac{3}{2} i+\frac{3}{2} j & 2-i-j & -2-i / 2-j / 2 \\ 2-i-j & -9 / 2+j / 2 & 7 / 2+i+j / 2 \\ -2-i / 2-j / 2 & 7 / 2+i+j / 2 & -1-i / 2\end{array}\right)$
$\mathrm{A}+\mathrm{B}=2 \mathrm{c}$
$\mathrm{C}=\left(\begin{array}{ccc}1+\frac{3}{2} i+\frac{3}{2} j & 2-i-j & -2-i / 2-j / 2 \\ 2-i-j & -9 / 2+j / 2 & \frac{7}{2}+i+j / 2 \\ -2-i / 2-j / 2 & \frac{7}{2}+i+j / 2 & -1-i / 2\end{array}\right)$
Theorem 1.5: If $A$ is aquaternion symmetric doubly stochastic matrix, then $1 / 2\left(A+A^{T}\right)$ is quaternion symmetric doubly stochastic matrix ${ }^{6}$.

Poof:
$1 / 2\left[\left(A+A^{T}\right)\right]^{T}=1 / 2\left[A^{T}+\left(A^{T}\right)\right]^{T}=1 / 2\left[A^{T}+A\right]=\left[\left(A^{T}\right)^{T}=A\right]$
$\Rightarrow 1 / 2\left[A^{T}+A\right]$
Where $\left[\left(\mathrm{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\mathrm{A}\right]$ is quaternion symmetric doubly stochastic matrix.
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\left(\mathrm{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\left(A^{T}\right)^{T}=A$
To prove $1 / 2\left(A+A^{T}\right)$ is quaternion (or) symmetric doubly stochastic matrix.
$1 / 2\left(A+A^{T}\right)^{T}$
$\left(\mathrm{A}+\mathrm{A}^{\mathrm{T}}\right)=\left(\begin{array}{ccc}2+2 i+4 j & 4-2 i-2 j & -4-2 j \\ 4-2 i-2 j & -12 & 10+2 i+2 j \\ -4-2 j & 10+2 i+2 j & -4-2 i\end{array}\right)$
$1 / 2\left(\mathrm{~A}+\mathrm{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\left(\mathrm{A}+\mathrm{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\left(\begin{array}{ccc}2+2 i+4 j & 4-2 i-2 j & -4-2 j \\ 4-2 i-2 j & -12 & 10+2 i+2 j \\ -4-2 j & 10+2 i+2 j & -4-2 i\end{array}\right)$
$1 / 2\left(A+\left(A^{T}\right)\right)^{T}$ is also an quaternion symmetric doubly stochastic matrix.
Property 1.5:
If $\mathrm{A} \in \mathrm{H}^{\mathrm{n} \mathrm{\times n}}$ is quaternion symmetric doubly stochastic matrix, then $1 / 2\left(\mathrm{~A}+\mathrm{A}^{\mathrm{T}}\right)=\mathrm{A}$
Proof:

$$
\begin{aligned}
& 1 / 2\left(\mathrm{~A}+\mathrm{A}^{\mathrm{T}}\right)=(2 \mathrm{~A}) / 2(\text { or })\left(2 \mathrm{~A}^{\mathrm{T}}\right) / 2 \\
& \text { Where } \mathrm{A}^{\mathrm{T}}=\mathrm{A} \\
& =\mathrm{A} \text { or } \mathrm{A}^{\mathrm{T}}
\end{aligned}
$$

Example 1.4:
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$

$$
\begin{aligned}
& \mathrm{A}^{\mathrm{T}}=\left(\begin{array}{ccc}
1+i+2 j & 2-i-j & -2-j \\
2-i-j & -6 & 5+i+j \\
-2-j & 5+i+j & -2-i
\end{array}\right) \\
& \mathrm{A}^{2}+\mathrm{A}^{\mathrm{T}}=\left(\begin{array}{ccc}
2+2 i+4 j & 2+i-2 j & -4-2 j \\
2+i-2 j & -12 & 10+2 i+2 j \\
-4-2 j & 10+2 i+2 j & -4-2 i
\end{array}\right) \\
&=2\left(\begin{array}{ccc}
1+i+2 j & 2-i-j & -2-j \\
2-i-j & -6 & 5+i+j \\
-2-j & 5+i+j & -2-i
\end{array}\right) \\
& 1 / 2\left(\mathrm{~A}+\mathrm{A}^{\mathrm{T}}\right)=2(\mathrm{~A}) / 2 \\
& 1 / 2\left(\mathrm{~A}+\mathrm{A}^{\mathrm{T}}\right)=\mathrm{A} . \text { Hence proved. }
\end{aligned}
$$

Property 1.6: If $\mathrm{A} \in \mathrm{H}^{\mathrm{n} \times \mathrm{n}}$ is quaternion symmetric doubly stochastic matrix then $\left(\mathrm{A}-\mathrm{A}^{\mathrm{T}}\right.$ ) is null matrix.
Proof:
If A is quaternion symmetric doubly stochastic matrix then $\mathrm{A}^{\mathrm{T}}=\mathrm{A}$.
Hence $\left(A-A^{T}\right)=0$ if $A^{T}=A$.
$\mathrm{A}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$\mathrm{A}^{\mathrm{T}}=\left(\begin{array}{ccc}1+i+2 j & 2-i-j & -2-j \\ 2-i-j & -6 & 5+i+j \\ -2-j & 5+i+j & -2-i\end{array}\right)$
$A-A^{\mathrm{T}}=\left(\begin{array}{lll}0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0\end{array}\right)$
$\left(\mathrm{A}-\mathrm{A}^{\mathrm{T}}\right)$ is an null matrix. Hence proved.
Definition 1.2:
A square matrix $A$ is said to be as quaternion orthogonal symmetric doubly stochastic matrix if $A A^{T}=A^{T} A=I$ Theorem:1.6

If $A$ is quaternion orthogonal symmetric doubly stochastic matrix, then $A^{T}$
is also quaternion orthogonal symmetric doubly stochastic matrix.
Proof:
since $A$ is quaternion orthogonal symmetric doubly stochastic matrix,
$A A A^{T}=A^{T} A=I$. therefore, $\left(A^{T}\right)^{T} A^{T}=A^{T}\left(A^{T}\right)^{T}$
$\mathrm{AA}^{\mathrm{T}}=\mathrm{A}^{\mathrm{T}} \mathrm{A}=\mathrm{I}$
$\Rightarrow \mathrm{A}^{\mathrm{T}}$ is quaternion orthogonal symmetric doubly stochastic matrix.
Example1.5:
$\mathrm{A}=\left(\begin{array}{lll}0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1\end{array}\right)$

Property 1.7
In particular case of
$\mathrm{A}_{2}=\left(\begin{array}{ll}0 & 1 \\ 1 & 0\end{array}\right) \mathrm{A}_{3}=\left(\begin{array}{lll}0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1\end{array}\right)$ etc are doubly stochastic matrices then they are all quaternion orthogonal symmetric doubly stochastic matrices (i.e,) $A_{2}{ }^{2}=I_{2}$ and $A_{3}{ }^{2}=I_{3}$

## Definition 1.3.

For any $\mathrm{B} \in \mathrm{H}^{\mathrm{nxn}}$ all doubly stochastic matrix is said to centro doubly stochastic matrix (or) centro bi stochastic matrix if $\mathrm{B}=\mathrm{Jn} \mathrm{B} \mathrm{Jn}$, where Jn is a exchange matrix.
Example 1.6 :
$\mathrm{B}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
$J_{3}=\left(\begin{array}{lll}0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0\end{array}\right)$
$\mathrm{J}_{3}$ В $_{3}=\left(\begin{array}{ccc}1+2 i+j & 2-i-j & -2-i \\ 2-i-j & -3+j & 2+i \\ -2-i & 2+i & 1\end{array}\right)$
