# Common Fixed Point Theorem for Weakly Compatible Mappings in Fuzzy Metric Spaces 

GEETA MODI*, MONA VERMA** and M.S. RATHORE ${ }^{1}$

(Acceptance Date 26th November, 2013)

#### Abstract

We prove common fixed point theorem for weakly compatible mappings in fuzzy metric space. We extend results of Pathak, Khan and Tiwari to fuzzy metric space.

## Introduction

In 1965 the concept of fuzzy sets was introduced by Zadeh ${ }^{14}$. It was developed extensively by many authors and used in various fields. Especially, Deng ${ }^{3}$, Erceg ${ }^{4}$, and Kramosil and Michalek ${ }^{10}$ have introduced the concepts of fuzzy metric spaces in different ways.

Recently, George and Veeramani ${ }^{7,8}$ modified the concept of fuzzy metric spaces introduced by kramosil and Michalek ${ }^{10}$ and defined the Hausdoff topology of fuzzy metric spaces. They showed also that every metric induces a fuzzy metric.

Grabiec ${ }^{6}$ extended the well known fixed point theorem of Banach ${ }^{1}$ and Edelstein ${ }^{5}$ to fuzzy metric spaces in the sense of Kramosil and Michalek ${ }^{10}$.

Here we extend results of Pathak,

Khan and Tiwari ${ }^{12}$ to fuzzy metric space.

## Preliminaries :

Definition ${ }^{13} 1$ : A binary operation *: $[0,1] \quad[0,1] \quad[0,1]$ is called a continuous $t$ norm if $([0,1], *)$ is an Abelian topological monoid with the unit 1 such that $\mathrm{a} * \mathrm{~b} \quad \mathrm{c} * \mathrm{~d}$ whenever a cand b dfor all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}$ are in [0,1].
Examples of t -norm are $\mathrm{a} * \mathrm{~b}=\mathrm{ab}$ and $\mathrm{a} * \mathrm{~b}=$ $\min \{\mathrm{a}, \mathrm{b}\}$.

Definition $2:{ }^{10}$ The 3-tuple (X,M, *) is called a fuzzy metric space (shortly FMspace) if X is an arbitrary set, * is a continuous t -norm and M is a fuzzy set in $\mathrm{X}^{2}[0, \quad$ ) satisfying the following conditions for all $\mathrm{x}, \mathrm{y}$, z in X and $\mathrm{t}, \mathrm{s}>0$,
$(F M-1) M(x, y, 0)=0$,
(FM-2) $\mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{t})=1$ for all $\mathrm{t}>0$ if and only
if $x=y$,
(FM-3) $M(x, y, t)=M(y, x, t)$,
(FM-4) M(x, y, t) $* M(y, z, s) \quad M(x, z, t+s)$, (FM-5) M(x, y, ):[0,1] [0,1] is left continuous.

In what follows, $\left(\mathrm{X}, \mathrm{M},{ }^{*}\right)$ will denote a fuzzy metric space. Note that
$\mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{t})$ can be thought as the degree of nearness between $x$ and $y$ with
respect to $t$. We identify $x=y$ with $M(x, y, t)$ $=1$ for all $\mathrm{t}>0$ and $\mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{t})=0$ with and we can find some topological properties and examples of fuzzy metric spaces in (George and Veeramani ${ }^{7}$ ).

Example 1: ${ }^{7}$ Let (X, d) be a metric space. Define $\mathrm{a} * \mathrm{~b}=\mathrm{ab}$ or $\mathrm{a} * \mathrm{~b}=\min \{\mathrm{a}, \mathrm{b}\}$ and for all $x, y$ in $X$ and $t>0$,

$$
M(x, y, t)=\frac{t}{t+d(x, y)}
$$

Then ( $\mathrm{X}, \mathrm{M},{ }^{*}$ ) is a fuzzy metric space. We call this fuzzy metric M induced by the metric d the standard fuzzy metric.

For workers of this line we are giving Lemmas.
Lemma 1: ${ }^{6}$ For all $\mathrm{x}, \mathrm{y} \quad \mathrm{X}, \mathrm{M}(\mathrm{x}, \mathrm{y},$. is non-decreasing.

Definition 3: ${ }^{6}$ Let (X, M, *) be a fuzzy metric space :
(1) A sequence $\left\{x_{n}\right\}$ in $X$ is said to be convergent to a point $\mathrm{x} \quad \mathrm{X}$ (denoted by $\lim _{\mathrm{n}}$ $\mathrm{x}_{\mathrm{n}}=\mathrm{x}$ ), if

$$
\lim _{\mathrm{n}} \quad \mathrm{M}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}, \mathrm{t}\right)=1,
$$

for all $\mathrm{t}>0$.
(2) A sequence $\left\{x_{n}\right\}$ in $X$ called a Cauchy sequence if
$\lim _{n} \quad M\left(X_{n+p}, x_{n}, t\right)=1$,
for all $\mathrm{t}>0$ and $\mathrm{p}>0$.
(3) A fuzzy metric space in which every Cauchy sequence is convergent is said to be complete.

Remark 1: Since * is continuous, it follows from (FM-4) that the limit of the sequence in FM -space is uniquely determined. Let (X,M,*) be a fuzzy metric space with the following condition:
(FM-6) $\lim _{t} \quad M(x, y, t)=1$ for all $x, y \quad X$.
Lemma $2:{ }^{11}$ If for all $\mathrm{x}, \mathrm{y} \quad \mathrm{X}, \mathrm{t}>0$ and for a number $\mathrm{k} \quad(0,1)$,
$\mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{kt}) \quad \mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{t})$
then $x=y$.
Lemma ${ }^{2,11}$ 3: Let $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ be a sequence in a fuzzy metric space ( $\mathrm{X}, \mathrm{M},{ }^{*}$ ) with the condition (FM-6). If there exists a number k $(0,1)$ such that

$$
\mathrm{M}\left(\mathrm{y}_{\mathrm{n}+2}, \mathrm{y}_{\mathrm{n}+1}, \mathrm{kt}\right) \quad \mathrm{M}\left(\mathrm{y}_{\mathrm{n}+1}, \mathrm{y}_{\mathrm{n}}, \mathrm{t}\right)
$$

for all $\mathrm{t}>0$ and $\mathrm{n}=1,2, \ldots \ldots$. then $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ is a Cauchy sequence in X .

Definition $4:{ }^{9}$ A pair of mappings S and T is called weakly compatible pair in fuzzy metric space if they commute at coincidence points; i.e. , if $\mathrm{Tu}=\mathrm{Su}$ for some u X , then $\mathrm{TSu}=\mathrm{STu}$.

It is easy to see that if $S$ and $T$ are compatible, then they are weakly compatible and the converse is not true in general.

Example 2 : Let $\mathrm{X}=\mathrm{R}_{+}$. Define S and T by:
$\mathrm{Sx}=\mathrm{x}$ and $\mathrm{Tx}=2 \mathrm{x}-1 ; \mathrm{Sx}=\mathrm{Tx}$ iff $\mathrm{x}=1$,
As $\mathrm{ST}(1)=\mathrm{S}(1)=1, \mathrm{TS}(1)=\mathrm{T}(1)=1$
Therefore $\{\mathrm{S}, \mathrm{T}\}$ are weakly compatible.

Let be the set of all continuous and increasing functions $\mathrm{i}_{\mathrm{i}}:[0,1] \quad[0,1]$ in any coordinate and $\mathrm{i}_{\mathrm{i}}(\mathrm{t})>\mathrm{t}$ for all $\mathrm{t} \quad[0,1)$ and $\mathrm{i}=$ $1,2,3,4,5$.

## Main Results

We extend results of Pathak, Khan and Tiwari ${ }^{12}$ to fuzzy metric spaces.

Theorem 1: Let (X, M, *) be a complete fuzzy metric space with $t^{*} t \quad t$ for all $\mathrm{t}[0,1]$. Let $\mathrm{A}, \mathrm{B}, \mathrm{S}$ and T be mappings of X into itself such that
(1.1) $A(X) \quad T(X)$ and $B(X) \quad S(X)$, (1.2) there exists a constant $k \quad(0,1)$ such that
$M^{2 p}(A x, B y, k t) \quad \min \left\{1\left(M^{2 p}(S x, T y, t)\right)\right.$, ${ }_{2}\left(\mathrm{Mq}(\mathrm{Sx}, \mathrm{Ax}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{Ty}, \mathrm{By}, \mathrm{t})\right)$, 3 ( $\left.\mathrm{M}^{\mathrm{r}}(\mathrm{Sx}, \mathrm{By},(2-\quad) \mathrm{t}) \cdot \mathrm{M}^{\mathrm{r}}(\mathrm{Ty}, \mathrm{Ax}, \mathrm{t})\right)$, ${ }_{4}\left(\mathrm{M}^{\mathrm{s}}(\mathrm{Sx}, \mathrm{Ax}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{s}}(\mathrm{Ty}, \mathrm{Ax}, \mathrm{t})\right)$, $\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{Sx}, \mathrm{By},(2-) \mathrm{t}) . \mathrm{M}^{\mathrm{l}}(\mathrm{Ty}, \mathrm{By}, \mathrm{t})\right)\right\}$,
for all $x, y \quad \mathrm{X}, \quad 0, \quad(0,2), \mathrm{t}>0, \mathrm{i} \quad$, $\mathrm{i}=1,2,3,4,5,0<\mathrm{p}, \mathrm{q}, \mathrm{q}^{\prime}, \mathrm{r}, \mathrm{r}^{\prime}, \mathrm{s}, \mathrm{s}^{\prime} 1, \mathrm{l}^{\prime} \quad 1$, such that $2 \mathrm{p}=\mathrm{q}+\mathrm{q}^{\prime}=\mathrm{r}+\mathrm{r}^{\prime}=\mathrm{s}+\mathrm{s}^{\prime}=1+\mathrm{l}^{\prime}$.
(1.3) If the pairs $\{\mathrm{A}, \mathrm{S}\}$ and $\{\mathrm{B}, \mathrm{T}\}$ are weakly compatible, then
$\mathrm{A}, \mathrm{B}, \mathrm{S}$ and T have a unique common fixed point in X .

Proof : Since A(X) T(X), for arbitrary point $\mathrm{x}_{0}$ in X , there exists a point $x_{1} \quad X$ such that $T x_{1}=A x_{0}$. Since $B(X)$ $S(X)$, for this point $x_{1}$ we can choose a point $\mathrm{x}_{2} \quad \mathrm{X}$ such that $\mathrm{Sx}_{2}=\mathrm{Bx}_{1}$ and so on. Continuing in this manner, we can define a
sequence $\left\{y_{n}\right\}$ in $X$ such that
(1.4) $\mathrm{y}_{2 \mathrm{n}}=\mathrm{T} \mathrm{x}_{2 \mathrm{n}+1}=\mathrm{Ax}_{2 \mathrm{n}}$ and $\mathrm{y}_{2 \mathrm{n}+1}=\mathrm{Sx}_{2 \mathrm{n}+2}=$ $\mathrm{Bx}_{2 \mathrm{n}+1}$ for $\mathrm{n}=1,2,3, \ldots$,
We need following Lemma for the proof of our mail Theorem.

Lemma 4 : Let $\mathrm{A}, \mathrm{B}, \mathrm{S}$ and T be selfmappings of a fuzzy metric space ( $\mathrm{X}, \mathrm{M}, *$ ) satisfying the conditions (1.1) and (1.2). Then the sequence $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ denoted by (1.4) is a Cauchy sequence in X .

Proof. For $\mathrm{t}>0$, By putting $\mathrm{x}=\mathrm{x}_{2 \mathrm{n}}$ and $\mathrm{y}=\mathrm{x}_{2 \mathrm{n}+1}$ in $(1.2), \quad=1-\mathrm{q}$, with $\mathrm{q} \quad(0,1)$ we have
$\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{kt}\right)=\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Ax}_{2 \mathrm{n}}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{kt}\right)$
$\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Ax}_{2 \mathrm{n}}, \mathrm{Bx}_{2 n+1}, \mathrm{kt}\right) \min \left\{{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Sx}_{2 n}, \mathrm{Tx}_{2 n+1}, \mathrm{t}\right)\right)\right.$, ${ }_{2}\left(\mathrm{M}^{\mathrm{q}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{q}^{\prime}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bx}_{2 \mathrm{n}+1},(2-) \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{r}}\left(\mathrm{Tx}_{2 n+1}\right.\right.$, $\left.\mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right)$ )
$4_{4}\left(\mathrm{M}^{\mathrm{s}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{s}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right)\right)$, ${ }_{5}\left(\mathrm{M}^{\mathrm{l}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bx}_{2 \mathrm{n}+1},(2-) \mathrm{t}\right) . \mathrm{M}^{\mathrm{l}^{\prime}\left(\mathrm{Tx}_{2 n+1},\right.}\right.$ $\left.\mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right)$ ) ,
$M^{2 p}\left(y_{2 n}, y_{2 n+1}, k t\right) \quad \min \left\{{ }_{1}\left(M^{2 p}\left(y_{2 n-1}, y_{2 n}, t\right)\right)\right.$, ${ }_{2}\left(\mathrm{M}^{\mathrm{q}}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{q}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}+1},(1+\mathrm{q}) \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{r}^{\mathrm{r}}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{t}\right)\right)$,
$4\left(M^{s}\left(y_{2 n-1}, y_{2 n}, t\right) \cdot M^{s^{\prime}}\left(y_{2 n}, y_{2 n}, t\right)\right)$,
${ }_{5}\left(\mathrm{M}^{1}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}+1},(1+\mathrm{q}) \mathrm{t}\right) . \mathrm{M}^{\mathrm{l}^{1}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1},\right.}\right.$ t)) \},
$M^{2 p}\left(y_{2 n}, y_{2 n+1}, k t\right) \min \left\{\quad{ }_{1}\left(M^{2 p}\left(y_{2 n-1}, y_{2 n}, t\right)\right)\right.$, ${ }_{2}\left(\mathrm{M}^{\mathrm{q}}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{t}\right) . \mathrm{M}^{\mathrm{q}^{\prime}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)$, ${ }_{3}\left(M^{\mathrm{r}}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{t}\right)^{*} \mathrm{M}^{\mathrm{r}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{qt}\right)\right) 1$ $4\left(\mathrm{M}^{\mathrm{s}}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{t}\right) 1\right)$,
$5\left(M^{1}\left(y_{2 n-1}, y_{2 n}, t\right) * M^{1}\left(y_{2 n}, y_{2 n+1}, q t\right)\right.$.
$\left.\left.\mathrm{M}^{\mathrm{l}^{\prime}}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)\right\}$,
Since the $t$-norm * is continuous and $\mathrm{M}(\mathrm{x}, \mathrm{y},$.
is continuous, letting $q \quad 1$, we have $M^{2 p}\left(y_{2 n}, y_{2 n+1}, k t\right) \quad \min \left\{\quad{ }_{1}\left(M^{2 p}\left(y_{2 n-1}, y_{2 n}, t\right)\right)\right.$, ${ }_{2}\left(M^{q}\left(y_{2 n-1}, y_{2 n}, t\right) \cdot M^{q^{\prime}}\left(y_{2 n}, y_{2 n+1}, t\right)\right),{ }_{3}\left(M^{r}\left(y_{2 n-1}\right.\right.$, $\left.\left.y_{2 n}, t\right)^{*} M^{r}\left(y_{2 n}, y_{2 n+1}, t\right)\right)$ $4\left(M^{s}\left(y_{2 n-1}, y_{2 n}, t\right)\right), \quad 5\left(M^{1}\left(y_{2 n-1}, y_{2 n}, t\right) *\right.$ $\left.\left.M^{1}\left(y_{2 n}, y_{2 n+1}, t\right) . M^{1}\left(y_{2 n}, y_{2 n+1}, t\right)\right)\right\}$,
$\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{kt}\right)$

as $i(t)>t$ for $0<t<1$. Thus $\left\{M\left(y_{2 n}, y_{2 n+1}, t\right)\right.$, $\mathrm{n} \quad 0\}$ is an increasing sequence of positive real numbers in $[0,1]$ and therefore tends to a limit $l$. We assert that $l=1$. If not, $l<1$ which on letting $n \quad$ in (1.5) one gets $l \quad(l)$ $>l$ a contradiction yielding thereby $l=1$. Therefore for every $\mathrm{n} \quad \mathrm{N}$, using analogous arguments one can show that $\left\{\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right.\right.$, t ), $\mathrm{n} \quad 0\}$ is a sequence of positive real numbers in $[0,1]$ which tends to a limit $l=1$. Therefore for every $n \quad N, M\left(y_{n}, y_{n+1}, t\right)>M\left(y_{n-1}, y_{n}, t\right)$ and
$\lim _{\mathrm{n}} \quad \mathrm{M}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}, \mathrm{t}\right)=1$.
Now for any positive integer $p$
$\mathrm{M}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+\mathrm{p}}, \mathrm{t}\right) \mathrm{M}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}, \mathrm{t} / \mathrm{p}\right)^{* \mathrm{p}^{-t i m e s}} \ldots * \mathrm{M}\left(\mathrm{y}_{\mathrm{n}+\mathrm{p}-1}\right.$, $\left.y_{n+p}, t / p\right)$.
Since $\lim _{n} \quad M\left(y_{n}, y_{n+1}, t\right)=1$ for $t>0$, it follows that
$\lim _{\mathrm{n}} \quad \mathrm{M}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+\mathrm{p}}, \mathrm{t}\right) \quad 1 * 1 \ldots * 1=1$
which shows that $\left\{y_{n}\right\}$ is a Cauchy sequence in X .
Now we prove our main result as follows:
Since X is complete, it follows by Lemma 4, that the sequence $\left\{y_{n}\right\}$ converges to a point $z$
in X . On the other hand, the sub sequences $\left\{\mathrm{Ax}_{2 \mathrm{n}}\right\},\left\{\mathrm{Bx}_{2 \mathrm{n}+1}\right\},\left\{\mathrm{Sx}_{2 \mathrm{n}}\right\}$ and $\left\{\mathrm{T}_{2 \mathrm{x}+1}\right\}$ of $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ also converges to the point z .
Now suppose that the subsequence $\left\{\mathrm{y}_{2 \mathrm{n}}\right\}$ is contained in $\mathrm{S}(\mathrm{X})$ and has a limit in $\mathrm{S}(\mathrm{X})$ call it z .
Let $\mathrm{u} \quad \mathrm{S}^{-1}(\mathrm{z})$. Then $\mathrm{Su}=\mathrm{z}$.
By (1.2) with = 1, we have
$\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Au}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{kt}\right)=\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Au}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{kt}\right)$
$\min \left\{{ }_{1}\left(\mathrm{M}^{2 p}\left(\mathrm{Su}, \mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right),{ }_{2}\left(\mathrm{M}^{\mathrm{q}}(\mathrm{Su}, \mathrm{Au}\right.\right.$,
t). $\left.\mathrm{M}^{\mathrm{q}}\left(\mathrm{Tx}_{2 n+1}, B \mathrm{X}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)$,

$$
\begin{aligned}
& { }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{Su}, \mathrm{Bx} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{r}^{\prime}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Au}, \mathrm{t}\right)\right) \\
& 4\left(\mathrm{M}^{\mathrm{s}}(\mathrm{Su}, \mathrm{Au}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{s}^{\prime}}\left(\mathrm{Tx}_{2 n+1}, \mathrm{Au}, \mathrm{t}\right)\right) \\
& \left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}\left(\mathrm{Su}, \mathrm{Bx}_{2 n+1}, t\right) \cdot \mathrm{M}^{\mathrm{l}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Bx}_{2 n+1}, \mathrm{t}\right)\right)\right\}
\end{aligned}
$$

which implies that as $n$, we have
$M^{2 p}(A u, z, k t) \quad \min \left\{{ }_{2}\left(M^{q}(z, A u, t)\right)\right.$,

$$
3_{3}\left(\mathrm{M}^{\mathrm{r}^{\prime}}(\mathrm{z}, \mathrm{Au}, \mathrm{t})\right),
$$

$$
4\left(\mathrm{M}^{\mathrm{s}+\mathrm{s}^{\prime}}(\mathrm{z}, \mathrm{Au}, \mathrm{t})\right\}
$$

$\mathrm{M}^{2 \mathrm{p}}(\mathrm{Au}, \mathrm{z}, \mathrm{kt}) \quad 4\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Au}, \mathrm{t})\right)>\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Au}, \mathrm{t})$
a contradiction. Therefore $\mathrm{Au}=\mathrm{z}=\mathrm{Su}$, i. e. $u$ is a coincidence point of $A$ and $S$.
Now suppose that the subsequence $\left\{\mathrm{y}_{2 n}\right\}$ is contained in $T(X)$ and has a limit in $T(X)$ call it z . Let $\mathrm{v} \mathrm{T}^{-1}(\mathrm{z})$. Then $\mathrm{Tv}=\mathrm{z}$.
Again by (1.2) with $=1$, we have
which implies that as n , we have

$$
\begin{aligned}
& M^{2 p}\left(y_{2 n}, B v, k t\right)=M^{2 p}\left(A x_{2 n}, B v, k t\right) \\
& \min \left\{{ }_{1}\left(M^{2 p}\left(S x_{2 n}, T v, t\right)\right),{ }_{2}\left(M ^ { q } \left(S x_{2 n}, A x_{2 n},\right.\right.\right. \\
& \text { t). } \left.\mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{Tv}, \mathrm{Bv}, \mathrm{t})\right) \text {, } \\
& { }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bv}, \mathrm{t}\right) . \mathrm{M}^{\mathrm{r}^{\prime}}\left(\mathrm{Tv}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right)\right), \\
& 4\left(\mathrm{M}^{\mathrm{s}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{s}^{\prime}}\left(\mathrm{Tv}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right)\right), \\
& \left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bv}, \mathrm{t}\right) . \mathrm{M}^{\mathrm{l}}(\mathrm{Tv}, \mathrm{Bv}, \mathrm{t})\right)\right\},
\end{aligned}
$$

$\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bv}, \mathrm{kt}) \quad \min \left\{\quad{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{z}, \mathrm{t})\right), \quad 2\left(\mathrm{M}^{\mathrm{q}}(\mathrm{z}, \quad=\mathrm{Sz}=\mathrm{z}\right.\right.$. $\left.\mathrm{z}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)$,

$$
3\left(\mathrm{M}^{\mathrm{r}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{r}^{\prime}}(\mathrm{z}, \mathrm{z}, \mathrm{t})\right), 4\left(\mathrm{M}^{\mathrm{s}}(\mathrm{z}\right.
$$

$$
\left.\mathrm{z}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{s}^{\prime}}(\mathrm{z}, \mathrm{z}, \mathrm{t})\right)
$$

$$
\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{l}^{\prime}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)\right\}
$$

or
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bv}, \mathrm{kt}) \quad \min \left\{1(1),{ }_{2}\left(\mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)\right.$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)$,

$$
\left.4(1), \quad 5\left(\mathrm{M}^{1+\mathrm{l}^{\prime}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)\right\}
$$

or
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bv}, \mathrm{kt}) \quad{ }_{5}\left(\mathrm{M}^{1+1^{\prime}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})\right)>\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bv}, \mathrm{t})$
a contradiction Therefore $\mathrm{Bv}=\mathrm{z}$. Since Tv $=\mathrm{z}$ thus $\mathrm{Tv}=\mathrm{Bv}=\mathrm{z}$
i.e. $v$ is a coincidence point of $B$ and $T$.

Since the pair $\{A, S\}$ is weakly compatible therefore, $A$ and $S$ commute at their coincidence point, i.e. if $A S w=S A w$ or $A z=S z$.

Similarly, since the pair $\{B, T\}$ is weakly compatible therefore, B and T commute at their coincidence point, i.e. if $\mathrm{BTw}=\mathrm{TBw}$ or $\mathrm{Bz}=\mathrm{Tz}$.
Now, we prove $\mathrm{Az}=\mathrm{z}$. By (1.2) with $=1$, we have which implies that as $n$, we have
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{z}, \mathrm{kt}) \quad \min \left\{\quad 1\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{z}, \mathrm{t})\right), 2(1)\right.$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}}(\mathrm{Az}, \mathrm{z}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{r}}{ }^{\prime}(\mathrm{z}, \mathrm{Az}, \mathrm{t})\right)$, $\left.{ }_{4}\left(\mathrm{M}^{\mathrm{s}^{\prime}}(\mathrm{z}, \mathrm{Az}, \mathrm{t})\right),{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{Az}, \mathrm{z}, \mathrm{t})\right)\right\}$,
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{z}, \mathrm{kt}) \quad{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{z}, \mathrm{t})>\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{z}, \mathrm{t})\right.$
a contradiction. Therefore $\mathrm{Az}=\mathrm{z}$. Thus Az

Now, we prove $\mathrm{Bz}=\mathrm{z}$. By (1.2) with $=1$, we have
$\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Ax}_{2 \mathrm{n}}, \mathrm{Bz}, \mathrm{kt}\right) \quad \min \left\{\quad{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Tz}, \mathrm{t}\right)\right)\right.$, ${ }_{2}\left(\mathrm{M}^{\mathrm{q}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{Tz}, \mathrm{Bz}, \mathrm{t})\right)$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bz}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{r}}\left(\mathrm{Tz}, \mathrm{Ax}_{2 \mathrm{n}}, \mathrm{t}\right)\right), \quad 4\left(\mathrm{M}^{\mathrm{s}}\left(\mathrm{Sx}_{2 \mathrm{n}}\right.\right.$, $\left.\left.A x_{2 n}, t\right) \cdot M^{s^{\prime}}\left(T z, A x_{2 n}, t\right)\right)$,
$\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}\left(\mathrm{Sx}_{2 \mathrm{n}}, \mathrm{Bz}, \mathrm{t}\right) . \mathrm{M}^{\mathrm{l}}(\mathrm{Tz}, \mathrm{Bz}, \mathrm{t})\right)\right\}$,
which implies that as $n$, we have
$M^{2 p}\left(\mathrm{Ax}_{2 \mathrm{n}}, \mathrm{Bz}, \mathrm{kt}\right) \quad \min \left\{1\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bz}, \mathrm{t})\right),{ }_{2}(1)\right.$, ${ }_{3}\left(\mathrm{M}^{\mathrm{r}+\mathrm{r}^{\prime}}(\mathrm{z}, \mathrm{Bz}, \mathrm{t})\right)$, $\left.{ }_{4}\left(\mathrm{M}^{\mathrm{s}}(\mathrm{Bz}, \mathrm{z}, \mathrm{t})\right),{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{z}, \mathrm{Bz}, \mathrm{t})\right)\right\}$,
or

$$
\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bz}, \mathrm{kt}) \quad 1\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bz}, \mathrm{t})>\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{Bz}, \mathrm{t})\right.
$$

a contradiction. Therefore $\mathrm{Bz}=\mathrm{z}$. Since Tz $=\mathrm{z}$ thus $\mathrm{Tz}=\mathrm{Bz}=\mathrm{z}$.
Combining the above results, we have
$\mathrm{Az}=\mathrm{Bz}=\mathrm{Sz}=\mathrm{Tz}=\mathrm{z}, \mathrm{z}$ is a common fixed point of $\mathrm{A}, \mathrm{B}, \mathrm{S}$ and T .
For the uniqueness of common fixed point let $\mathrm{w}(\mathrm{z} \quad \mathrm{w})$ be another common fixed point of A, B, S and T. Then by (1.2) with $=1$, we have
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{w}, \mathrm{kt})=\mathrm{M}^{2 \mathrm{p}}(\mathrm{Az}, \mathrm{Bw}, \mathrm{kt})$
$\min \left\{{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{Sz}, \mathrm{Tw}, \mathrm{t})\right),{ }_{2}\left(\mathrm{M}^{\mathrm{q}}(\mathrm{Sz}, \mathrm{Az}, \mathrm{t})\right.\right.$. $\left.\mathrm{M}^{\mathrm{q}^{\prime}}(\mathrm{Tw}, \mathrm{Bw}, \mathrm{t})\right)$,
${ }_{3}\left(\mathrm{M}^{\mathrm{r}}(\mathrm{Sz}, \mathrm{Bw}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{r}^{\prime}}(\mathrm{Tw}, \mathrm{Az}, \mathrm{t})\right),{ }_{4}\left(\mathrm{M}^{\mathrm{s}}(\mathrm{Sz}\right.$, $\left.\mathrm{Az}, \mathrm{t}) . \mathrm{M}^{\mathrm{s}^{\prime}}(\mathrm{Tw}, \mathrm{Az}, \mathrm{t})\right)$,
$\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{Sz}, \mathrm{B} w, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{l}}(\mathrm{Tw}, \mathrm{B} w, \mathrm{t})\right)\right\}$,
or
$M^{2 p}(z, w, k t) \quad \min \left\{{ }_{1}\left(M^{2 p}(z, w, t)\right),{ }_{2}\left(M^{q}(z\right.\right.$, $\left.\mathrm{z}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{q}}(\mathrm{w}, \mathrm{w}, \mathrm{t})\right)$,
${ }_{3}\left(M^{r}(z, w, t) \cdot M^{r}(w, z, t)\right), 4\left(M^{s}(z, z, t)\right.$.
$\left.\mathrm{M}^{\mathrm{s}^{\prime}}(\mathrm{w}, \mathrm{z}, \mathrm{t})\right)$,
$\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}(\mathrm{z}, \mathrm{w}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{l}}(\mathrm{w}, \mathrm{w}, \mathrm{t})\right)\right\}$,
$M^{2 p}\left(A z, y_{2 n+1}, k t\right)=M^{2 p}\left(A z, \mathrm{Bx}_{2 n+1}, k t\right)$
$\min \left\{{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}\left(\mathrm{Sz}, \mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right),{ }_{2}\left(\mathrm{M}^{\mathrm{q}}(\mathrm{Sz}, \mathrm{Az}, \mathrm{t})\right.\right.$.
$\left.\mathrm{M}^{\mathrm{q}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)$,
${ }_{3}\left(\mathrm{M}^{\mathrm{r}}\left(\mathrm{Sz}_{\mathrm{z}}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right) \cdot \mathrm{M}^{\mathrm{r}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Az}, \mathrm{t}\right)\right)$,
$4\left(\mathrm{M}^{\mathrm{s}}(\mathrm{Sz}, \mathrm{Az}, \mathrm{t}) \cdot \mathrm{M}^{\mathrm{s}^{\prime}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, A z, \mathrm{t}\right)\right)$,
$\left.{ }_{5}\left(\mathrm{M}^{\mathrm{l}}\left(\mathrm{Sz}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right) . \mathrm{M}^{\mathrm{l}}\left(\mathrm{Tx}_{2 \mathrm{n}+1}, \mathrm{Bx}_{2 \mathrm{n}+1}, \mathrm{t}\right)\right)\right\}$,
$\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{w}, \mathrm{kt}) \quad{ }_{1}\left(\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{w}, \mathrm{t})\right)>\mathrm{M}^{2 \mathrm{p}}(\mathrm{z}, \mathrm{w}, \mathrm{t})$.
a contradiction. Therefore $\mathrm{z}=\mathrm{w}$. This completes the proof of the Theorem.
