#### Abstract

In this paper we introduce the notion of a maximal lattice of groups. We also prove some theorems regarding maximal lattices and based on them develop a method to construct the maximal lattice of any finite cyclic group.

Key words : Cyclic groups of prime order, maximal lattice, Lfuzzy subgroups.

## 1. Introduction

The initial stages of the development of the subject of Partially ordered sets and lattices are found in the works of mathematicians like George Boole, Richard Dedekind, Charles Sanders Pierce and Earnest Schröder. Garrett Birkhoff ${ }^{2}$ developed this subject into a full-fledged one in 1930's. Fuzzy set theory and fuzzy logic were developed by Lotfi A. Zadeh in $1965^{10}$. J.A. Goguen ${ }^{5}$ considered a complete and distributive lattice $L$ for the membership set, instead of the closed interval $[0,1]$ used by Zdeh; thus introducing the concept of L-fuzzy set. In 1971 Azriel Rosenfeld ${ }^{8}$ fuzzified the theory of groups. Just like fuzzy sets were generalized using lattices as membership sets, fuzzy groups also could be generalized.

Cyclic groups of prime power order are very important in the study of groups
because of the fact that they are the building blocks of finite groups. In this paper, we investigate how to assign a maximal lattice L to a cyclic group of prime power order using its L-fuzzy subgroups and extend it to any finite cyclic group. We also develop a method to construct maximal lattices and illustrate it with some examples. Terms and notations in Lattice Theory used in this paper are as found in Bernard Kolman ${ }^{1}$ and Devey B.A. ${ }^{3}$.

## 2. Basic concepts :

A relation $\leq$ on a set A is called a partial order if $\leq$ is reflexive, antisymmetric and transitive. The set A together with the partial order $\leq$ is called a partially ordered set (or a poset) and is denoted as $(\mathrm{A}, \leq)$ or simply A . The elements a and b of a poset A are said to be comparable if if $\mathrm{a} \leq \mathrm{b}$ or $\mathrm{b} \leq \mathrm{a}$. If every pair of elements in a poset A is comparable,
we say that A is a linearly (or totally) ordered set and the partial order in this case is called a linear (total) order. We also say that such an A is a chain. For any set S , its power set $P(\mathrm{~S})$ together with set inclusin $\subseteq$ is a poset. If $|S| \leq 2$, it is not totally ordered. The set $\mathrm{Z}^{+}$of positive integers together with the usual order $\leq$ is a totally ordered set(toset). An element $a \in \mathrm{~A}$ is called a maximal element of A if there is no element $c$ in A such that $a<c$ and an element element $b \in \mathrm{~A}$ is called a minimal element of A if there is no element $c$ in A such that $c<b$. An element $a \in \mathrm{~A}$ is called a greatest element of A if $x \leq a$ for all $x \in \mathrm{~A}$. An element $a \in \mathrm{~A}$ is called a least element of A if $a \leq x$ for all $x$ $\in \mathrm{A}$. The greatest element of a poset, if it exists, is denoted by I and is called the unit element. The least element of a poset, if it exists, is denoted by O and is called the zero element.

Consider a poset A and a subset B of A. An element $a \in \mathrm{~A}$ is called an upper bound of B if $b \leq a$ for all $b \in \mathrm{~B}$. An element $a \in \mathrm{~A}$ is called a lower bound of B if $a \leq \mathrm{b}$ for all $b$ $\in \mathrm{B}$. An element $\mathrm{a} \in \mathrm{A}$ is called a least uper bound of B or supremum of $B$ denoted as $\operatorname{lub}(B)$ or $\sup B$ or $\vee B$ if $a$ is an upper bound of $B$ and $a \leq a^{\prime}$, whenever $a^{\prime}$ is an upper bound of B . An element $\mathrm{a} \in \mathrm{A}$ is called a greatest lower bound of B or infimum of B denoted as $\operatorname{glb}(B)($ or $\inf B$ or $\wedge B)$, if $a$ is a lower bound of $\mathrm{B}^{\prime} \leq \mathrm{a}$, whenever $\mathrm{a}^{\prime}$ is a lower bound of $B$. lattice is a poset $(\mathrm{L}, \leq)$ inwhich every subset $\{\mathrm{a}, \mathrm{b}\}$ consisting of two elements has a least upper bound and a greatest lower bound. We denote lub ( $\{a, b$,$\} ) and glb (\{a, b\})$ by $a \vee b$ and $a \wedge b$ respectively and call them the join and meet respectively of $a$ and $b$.

For any non-empty set $\mathrm{S},(\mathcal{P}(\mathrm{S}), \subseteq)$ is a poset. For any $\mathrm{A}, \mathrm{B} \in \mathscr{P}(\mathrm{S}), \mathrm{A} \vee \mathrm{B}=\mathrm{A} \cup \mathrm{B}$ and
$\mathrm{A} \wedge \mathrm{B}=\mathrm{A} \cap \mathrm{B}$ exist and so it is a lattice. Another example of a lattice is ( $\mathrm{Z}^{+}, \leq$) where $\leq$is defined by $a \leq b$ iff a divides b . Here $a \vee b=\mathrm{lcm}$ $(a, b)$ and $a \wedge b=\operatorname{gcd}(a, b)$. Now for any positive integer n , let $\mathrm{D}_{\mathrm{n}}$ denote the set of all positive divisors of $n$. Then $\mathrm{D}_{\mathrm{n}}$ together with the relation 'divisibility' is a lattice.

A non-empty subset $S$ of a lattice $L$ is called a sublattice of $L$ if $a, b \in S \Rightarrow a \wedge b$, $a \vee b \in S$. If ( $\mathrm{A}, \leq$ ) and ( $\mathrm{B}, \leq$ ) are posets, then $(\mathrm{AXB}, \leq)$ is a poset, with partial order $\leq$ defined by $(\mathrm{a}, \mathrm{b}) \leq\left(\mathrm{a}^{\prime}, \mathrm{b}^{\prime}\right)$ if $\mathrm{a} \leq \mathrm{a}^{\prime}$ in A and $\mathrm{b} \leq \mathrm{b}^{\prime}$ in B . The partial order $\leq$ defined on the Cartesian product A X B is called the product partial order. If $\left(\mathrm{L}_{1}, \leq\right)$ and $\left(\mathrm{L}_{2}, \leq\right)$ are lattices, then $\left(\mathrm{L}_{1}, \mathrm{XL}_{2}, \leq\right)$ is a lattice called the product lattice of $\mathrm{L}_{1}$ and $\mathrm{L}_{2}$ where the partial order $\leq$ of L is the product partial order. Here $\left(a_{1}, b_{1}\right) \vee\left(a_{2}, b_{2}\right)=$ $\left(a_{1} \vee a_{2}, b_{1} \vee b_{2}\right)$ and $\left(a_{1}, b_{1}\right) \wedge\left(a_{2}, b_{2}\right)=\left(a_{1} \wedge a_{2}\right.$, $b_{1} \vee b_{2}$ ).
2.1. Definition ${ }^{1}$ : A lattice L is called distributive if for any elements $a, b$ and $c$ in L, we have the following distributive properties:

1. $a \wedge(b \vee c)=(a \wedge b) \vee(a \wedge c)$
2. $a \vee(b \wedge c)=(a \vee b) \wedge(a \vee c)$
2.2. Definition ${ }^{1}$ : A lattice L is said to be complete if every non-empty subset of it has glb and lub

If $L_{1}$ and $L_{2}$ are complete lattices, then $\mathrm{L}_{1} \mathrm{XL}_{2}$ is also a complete lattice with joins and meets being formed co-ordinate wise.
2.3. Example : $(\mathcal{P}(\mathrm{S}), \subseteq)$ is a complete and distributive lattice.
2.4. Definition ${ }^{4}$ : Given a universal set X, a Fuzz Set on X (or a fuzzy subset of $X)$ is defined as a function $A: X \rightarrow[0,1]$. Its range is denoted as $\operatorname{Im}(A)$.
2.5. Example : Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}, \mathrm{e}\}$. Define $\mathrm{A}: \rightarrow[0,1]$ by $\mathrm{A}(\mathrm{a})=0.1 ; \mathrm{A}(\mathrm{b})=0.2 ; \mathrm{A}(\mathrm{c})=0.3$; $A(d)=0.4 ; A(e)=0.5$. Then $A$ is fuzzy subset of $X$ and $\operatorname{Im}(A)=\{0.1,0.2,0.3,0.4,0.5\}$.
2.6. Definition ${ }^{5}$ : If L is a lattice and X is a universal set, then an $L$-fuzzy set $A$ on $X$ (or an L-fuzzy subset $A$ of X ) is a function $\mathrm{A}: \mathrm{X} \rightarrow \mathrm{L}$. We shall write $\mathrm{A} \in \mathrm{L}^{\mathrm{X}}$ for $A$ is an $L$ fuzzy set on $X$.
2.7. Example : Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}$ and $\mathrm{L}=\mathrm{D}_{6}=\{1,2,3,6\}$ under the relation divisibility. Define $\mathrm{A}: \mathrm{X} \rightarrow \mathrm{L}$ by $\mathrm{A}(\mathrm{a})=1, \mathrm{~A}(\mathrm{~b})=2, \mathrm{~A}(\mathrm{c})=3$ and $A(d)=6$. Then $A$ is an L-fuzzy set on $X$.

## 3. Fuzzy Groups :

3.1. Definition ${ }^{8}$ : A fuzzy subset A of a multiplicative group G is said to be a fuzzy subgroup of G or a fuzzy group on $G$ if for every $x, y \in G$
(i) $\mathrm{A}(\mathrm{xy}) \geq \min \{\mathrm{A}(\mathrm{x}), \mathrm{A}(\mathrm{y})\}$ and (ii) $\mathrm{A}\left(\mathrm{x}^{-1}\right)=\mathrm{A}(\mathrm{x})$.
3.2. Example : Let $\mathrm{G}=\{1,-1,-\mathrm{i}\}$ under multiplication of complex numbers. Define A: $\mathrm{G} \rightarrow[0,1]$ by $\mathrm{A}(1)=1, \mathrm{~A}(-1)=0.5, \mathrm{~A}(\mathrm{i})=\mathrm{A}$ $(-i)=0.25$. Then $A$ is a fuzzy subgroup of $G$.
3.3. Definition ${ }^{7}$. An L-fuzzy subset A of G is called an L-fuzzy subgroup of G (or an L-fuzzy group on G ) if
(i) $\mathrm{A}(\mathrm{xy}) \geq \mathrm{A}(\mathrm{x}) \wedge \mathrm{A}(\mathrm{y}), \forall \mathrm{x}, \mathrm{y} \in \mathrm{G}$, and
(ii) $\mathrm{A}\left(\mathrm{x}^{-1}\right) \geq \mathrm{A}(\mathrm{x}), \forall \mathrm{x} \in \mathrm{G}$

It may be recalled that for any positive integer $\mathrm{n}, \mathrm{Z}_{\mathrm{n}}=\{0,1,2, \ldots, \mathrm{n}-1\}$ is a group with respect to addition modulo n .
3.4. Example. Let G be the group $\mathrm{Z}_{6}=\{0,1,2,3,4,5\}$ under addition modulo 6.Take $\mathrm{L}=\mathrm{D}_{6}=\{1,2,3,6\}=\{0, \mathrm{a}, \mathrm{b}, 1\}$ where 0 and 1 denote 1 and 6 respectively; and a and b are 2 or 3 (interchangeable). Define $A: Z_{6} \rightarrow D_{6}$ by $\mathrm{A}(0)=1, \mathrm{~A}(2)=\mathrm{A}(4)=\mathrm{a}, \mathrm{A}(3)=\mathrm{b}$ and $\mathrm{A}(1)=\mathrm{A}$ $(5)=0$. Then A is an L-fuzzy group on $\mathrm{Z}_{6}$.
3.5. Example. Let $\mathrm{V}=\{\mathrm{e}, \mathrm{a}, \mathrm{b}, \mathrm{c}\}$ be the Klein-4 group, whose composition table is as follows:

Table (i): Definition of binary operation * on V.

| $*$ | e | a | b | c |
| :---: | :---: | :---: | :---: | :---: |
| e | a | a | b | c |
| a | a | e | c | b |
| b | b | c | e | a |
| c | c | b | a | e |

Let $L=D_{6}=\{0, x, y, 1\}$. Define $A: V \rightarrow$ $D_{6}$ by $A(e)=1, A(a)=x, A(b)=y$ and $A(c)=0$. Then A is an L-fuzzy group on V .
3.6. Lemma $^{7}$. Let G be a group and $\mathrm{A} \in \mathrm{L}^{\mathrm{G}}$. Then A is an L-fuzzy group on G iff $A_{a}=\{x / x \in G, A(x) \geq a\}$ is a subgroup of $G, \forall a$ $\in \mathrm{A}(\mathrm{G}) \cup\{\mathrm{b} \in \mathrm{L} / \mathrm{b} \leq \mathrm{A}(\mathrm{e})\}$
3.7. Notation ${ }^{8}$. If G is a group and L is a lattice, then (G,L) shall denote the collection of all L-fuzzy groups on G .
3.8. Example. Consider the group $\left\langle\mathrm{Z}_{18,},{ }_{18}>\right.$ and the lattice $D_{12}=\{1,2,3,4,6,12\}$. Define
$\mathrm{A}: \mathrm{Z}_{18} \rightarrow \mathrm{D}_{12}$ by $\mathrm{A}: 0 \mapsto 12,\{3,15\} \mapsto 2,\{6,12\} \mapsto$ $6,9 \mapsto 4,\{2,4,8,10,14,16\} \mapsto 3,\{1,5,7,11,13$, $17\} \mapsto 1$. Then A is an L-Fuzzy subgroup of $\mathrm{Z}_{18}$ as can be verified using the lemma 3.6.
4. L-fuzzy subgroups of finite cyclic groups:
4.1. Definition. Let $\mathrm{L}=\left(\left\{\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots \ldots . \mathrm{a}_{\mathrm{n}}\right\}, \leq\right)$ be a lattice. We say that L is a finite lattice containing n points and write $|\mathrm{L}|=\mathrm{n}$.
4.2. Example. $\mathrm{D}_{6}=\{1,2,3,6\}$ is a lattice under divisibility. It is a finite lattice containing four points and so $\left|D_{6}\right|=4$.
4.3. Definition. Let G be a group, L be a finite lattice and A: $\mathrm{G} \rightarrow \mathrm{L}$ be an L-fuzzy group. A is said to saturate $\operatorname{L}$ if $\operatorname{Im}(\mathrm{A})=\mathrm{L}$. If there is an L-fuzzy group A on G which saturates L , then we say that $G$ saturates $\boldsymbol{L}$.
4.4. Example. Consider $G=\langle Z,+\rangle$ and $\mathrm{L}=(\{0,1 / 3,1 / 2,1\}, \leq)$. Define $\mathrm{A}: \mathrm{G} \rightarrow \mathrm{L}$ by $\mathrm{A}(0)=1, \mathrm{~A}(\mathrm{x})=1 / 2$ if $\mathrm{x} \in 4 \mathrm{Z}-\{0\}, \mathrm{A}(\mathrm{x})=1 / 3$ if $x \in 2 Z-4 Z$ and $A(x)=0$ if $x \in Z-2 Z$. Then $A$ is an L-fuzzy group on $G$ with $\operatorname{Im}(A)=L$. Hence, A as well as $G$ saturates $L$.
4.5. Example .Let $\mathrm{G}=\left\langle\mathrm{Z}_{4},+4\right.$ and $\mathrm{L}=(\{0,1\}, \leq)$. Define A: $\mathrm{G} \rightarrow \mathrm{L}$ by $\mathrm{A}(0)=1$; $\mathrm{A}(\mathrm{x})=0$, if $\mathrm{x} \neq 0$. Then A is an L-fuzzy group on G which saturates L and so G also saturates L .
4.6. Example. Let $\mathrm{G}=\left\langle\mathrm{Z}_{4},+4\right\rangle$ and $\mathrm{L}=(\{0,1 / 2,1\}, \leq)$. Define $\mathrm{A}: \mathrm{G} \rightarrow \mathrm{L}$ by $\mathrm{A}(0)=1$; $A(x)=0$, if $x \neq 0$. Here $A$ is an L-fuzzy group on $G$ with $\operatorname{Im}(A) \neq L$. Hence $A$ does not saturate L. But if we define $\mathrm{B}: \mathrm{G} \rightarrow \mathrm{L}$ by $\mathrm{B}(0)=1 ; \mathrm{B}(2)=$ $1 / 2$ and $B(1)=B(3)=0$, then $B$ is an L-fuzzy group on $G$ which saturates $L$ and hence $G$
also saturates L .
4.7. Definition. Let G be a group and $L$ be a finite lattice. A sublattice $L_{1}$ of $L$ is said to be a maximal lattice saturated by G if there is an $A \in(G, L)$ which saturates $L_{1}$ and there is no $B \in(G, L)$ which saturates a sublattice $\mathrm{L}_{2}$ of L with $\left|\mathrm{L}_{2}\right|>\left|\mathrm{L}_{1}\right|$.
4.8. Example. Consider the sublattices $\mathrm{L}_{1}=\{0,1\}$ and $\mathrm{L}_{2}=\{0,1 / 2,1\}$ of $\mathrm{L}=\{0,1 / 3,1 / 2,1\}$ and let $\mathrm{G}=\left\langle\mathrm{Z}_{4},+{ }_{4}\right\rangle$. Define $\mathrm{A}: \mathrm{G} \rightarrow \operatorname{Lby} \mathrm{A}(0)=1$; $A(x)=0$, if $\mathrm{x} \neq 0$. Also define $\mathrm{B}: \mathrm{G} \rightarrow \mathrm{L}$ by $\mathrm{B}(0)=1$; $B(2)=1 / 2$ and $B(1)=B(3)=0$. Then $L_{1}$ is not a maximal lattice of G , because there is $\mathrm{L}_{2}$ with $\left.\left|L_{2}\right|\right\rangle\left|L_{1}\right|$ and $B: G \rightarrow L$ which saturates $L_{2}$. It can be shown that $L_{2}$ is a maximal lattice for $G$.

We may recall that a group G is said to be of prime power order if $|G|=p^{n}$, for some prime number p and positive integer n .
4.9. Theorem ${ }^{9}$. Let G be a cyclic group of prime power order. Then the lattice of all subgroups of G is a chain
4.10. Theorem. Let G be a cyclic group of prime power order. Then a maximal lattice $L_{G}$ for $G$ is a chain isomorphic to the chain of all subgroups of G .

Proof: Suppose that the order of G is $\mathrm{p}^{\mathrm{r}}$, where p is a prime and r is a positive integer. Then $G$ has $r+1$ subgroups in all, which form a chain. Let $\mathrm{L}_{1}: \mathrm{G}_{0}=\{\mathrm{e}\} \subset \mathrm{G}_{1} \subset \mathrm{G}_{2} \subset$ $\ldots \ldots \ldots \subset \mathrm{G}_{\mathrm{r}-1} \subset \mathrm{G}_{\mathrm{l}}=\mathrm{G}$ be this chain of subgroups. Find a subchain $\mathrm{L}_{2}: 0=\mathrm{a}_{0}<\mathrm{a}_{1}<\mathrm{a}_{2}<\ldots \ldots \ldots .<\mathrm{a}_{\mathrm{r}-1}<$ $\mathrm{a}_{1}=1$ of the chain $\mathrm{L}=[0,1]$ and define $\mathrm{A}: \mathrm{G} \rightarrow \mathrm{L}$ by

$$
\begin{aligned}
& \mathrm{A}(\mathrm{e})=1 \\
& \begin{array}{rlr}
\mathrm{A}(\mathrm{x})= & \mathrm{a}_{\mathrm{r}-1}, & \text { if } \times \mathrm{G}_{1}-\{\mathrm{e}\} \\
& =\mathrm{a}_{\mathrm{r}-2}, & \text { if } \times \mathrm{G}_{2}-\mathrm{G}_{1} \\
& \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \\
& \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \\
& =a_{1}, & \text { if } \times \mathrm{G}_{\mathrm{r}-1}-\mathrm{G}_{\mathrm{r}-2} \quad \text { and } \\
& =0, & \text { if } \times \mathrm{G}_{-}-\mathrm{G}_{\mathrm{r}-1} .
\end{array}
\end{aligned}
$$

Then the level set $A_{a_{i}}$ is a subgroup of G for each $\mathrm{a}_{\mathrm{i}}, 0 \leq i \leq r$. Hence, by lemma $3.6, \mathrm{~A}$ is an L-fuzzy subgroup of $G$. It is clear that $G$ saturates $\mathrm{L}_{2}$. Now we shall show that $\mathrm{L}_{2}$ is maximal. Suppose that $L_{2}$ is not maximal. Then we can find a subchain $L_{3}$ of $L$ having more points (between 0 and 1) than $L_{2}$ has. Also there is some $\mathrm{L}-$ fuzzy subgroup $\mathrm{B}: \mathrm{G} \rightarrow \mathrm{L}$ which saturates $\mathrm{L}_{3}$. Let b be a point in $\mathrm{L}_{3}$ other than $\mathrm{a}_{\mathrm{i}}, 0 \leq i \leq r$. Then, $a_{j-1}<b<a_{j}$ for some $j$. Since $L_{3}$ is saturated by $B$, there exists some subset $X(\neq \varnothing)$ of $G$ such that $B(X)=\{b\}$. Now by lemma 3.6 , the level subset $B_{b}$ is a subgroup of G. Since, $a_{j-1}$ $<\mathrm{b}<\mathrm{a}_{\mathrm{j}}, \mathrm{B}_{\mathrm{b}}$ is different from all the subgroups $B_{a_{i}}, 0 \leq i \leq r$. Thus corresponding to each such b we get one subgroup in addition to the subgroups determined by $\mathrm{a}_{\mathrm{i}}$. This produces more than $\mathrm{r}+1$ subgroups for $G$, which is impossible since $G$ has precisely $\mathrm{r}+1$ subgroups. This contradiction shows that $L_{2}$ is maximal. Thus the maximal lattice $\mathrm{L}_{\mathrm{G}}=\mathrm{L}_{2}$.It is easily seen that $\mathrm{L}_{-2}$ is isomorphic to $\mathrm{L}_{1}$
4.11. Corollary. A maximal chain for a cyclic group of prime power order is unique up to isomorphism.

Proof: Let G be a group of prime power order and $L_{1}$ and $L_{2}$ be two maximal chains
for $G$. Then $L_{1}$ and $L_{2}$ are isomorphic to the chain of subgroups of $G$ and as such they are isomorphic to each other
4.12. Remark. In view of the above corollary, we can talk of the maximum chain for a cyclic group of prime power order.
4.13. Corollary. The maximum chain for a group of prime order is $\{0,1\}$.

Proof: Let G be a group of prime order $p$. Then it is cyclic of order $p^{1}=p$. Hence by theorem 4.10 it has two points in its chain of subgroups and so is the maximum chain. Hence the result
4.14. Corollary. For any prime number $p$, the maximum chain for $Z_{p}$ is $\{0,1\}$.
4.15. Corollary. If p is a prime number and n is any positive integer then the maximum chain for is $0=a_{0}<a_{1} \ldots \ldots . .<a_{n}=1$
4.16. Example. $\mathrm{Z}_{8}$ is a prime powered group since $\left|Z_{8}\right|=8=2^{3}$. Hence, by corollary 4.15.,the maximum chain of $\mathrm{Z}_{8}$ is $0=\mathrm{a}_{0}<\mathrm{a}_{1}$ $<\mathrm{a}_{2}<\mathrm{a}_{3}=1$.

It is well-known that every finite cyclic group of order $n$ is isomorphic to $\mathrm{Z}_{\mathrm{n}}$. So, henceforth we represent cyclic groups of order $n$ by $Z_{n}$.
4.17. Proposition ${ }^{6}$. The group $\mathrm{Z}_{\mathrm{m}} \mathrm{X}$ $Z_{n}$ is isomorphic to $Z_{m n}$ if and only if $m$ and $n$ are relatively prime
4.18. Proposition ${ }^{6}$. The group $\prod_{i=1}^{n} Z_{m_{i}}$
is cyclic and isomorphic to if and only if the number $m_{i}$, for $i=1,2 \ldots$ n are pairwise relatively prime
4.19. Proposition ${ }^{6}$. Suppose $\mathrm{n}=p_{1}{ }^{n_{1}} p_{2}{ }^{n_{2}} \ldots \ldots . . p_{r}{ }^{n_{r}}$, where $\mathrm{p}_{\mathrm{i}}$ 's are distinct primes. Then $\mathrm{Z}_{\mathrm{n}}$ is isomorphic to $Z_{p_{1}{ }^{n_{1}} X}$ $Z_{p_{2}}{ }^{n_{2}} \ldots \ldots . X Z_{p_{r}}{ }^{n_{r}}$
4.20. Theorem. Suppose $\mathrm{n}=p_{1}{ }^{n_{1}} p_{2}{ }^{n_{2}}$ $\ldots \ldots . . p_{r}{ }^{n_{r}}$, where $\mathrm{p}_{\mathrm{i}}$ 's are distinct primes. Then the maximum lattice for $\mathrm{Z}_{\mathrm{n}}=Z_{p_{1}} n_{1} X Z_{p_{2}{ }^{n_{2}}}$ ...... $X Z_{p_{r}{ }^{n_{r}}}$ is the product lattice of the maximum chains for the factors $Z_{p_{i}} n_{i}$.

Proof: By theorem 4.10, each $Z_{p_{i}}{ }^{n_{i}}$ has a chain of $\left(n_{i}+1\right)$ points as its maximum lattice. Let $L$ be the product of these chains under partial order product. Then L has $\prod_{i=1}^{r}\left(n_{i}+1\right)$ points. Each $Z_{p_{i}{ }^{n_{i}}}$ is a cyclic group of prime power order. It has $\left(\mathrm{n}_{\mathrm{i}}+1\right)$ subgroups. Hence there are $\prod_{i=1}^{r}\left(n_{i}+1\right)$ subgroups of $\mathrm{Z}_{\mathrm{n}}$ altogether. Corresponding to each subgroup we can find a point on the lattice L . This is possible because there is a 1-1 correspondence between subgroups of $Z_{p_{i}{ }^{n_{i}}}$ and the points of its chain. We can define an L-fuzzy set $A: Z_{n} \rightarrow$ Lin such a manner that the level set $A_{a}$ for each $a \in L$ is a subgroup of $Z_{n}$. Then $A$ is an $L$-fuzzy subgroup of $Z_{n}$. It is obvious that A saturates L. Since each chain is maximum for the corresponding cyclic group, L is maximum for the product group
4.21. Example. $\mathrm{Z}_{6} \cong \mathrm{Z}_{2} \mathrm{X}_{3}$. The
maximum chain for both $Z_{2}$ and $Z_{3}$ is $D_{2}=\{0,1\}$.
Take $Z_{6}=\{0,1\} X\{0,1,2\}=\{00,01,02,10,11,12\}$.
Its composition table is given below in table (ii): Addition on the first digit is modulo 2 and that on second is modulo 3 .

Table (ii): Composition table for $\mathrm{Z}_{2} \mathrm{XZ}_{3}$.

| + | 00 | 01 | 02 | 10 | 11 | 12 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| 00 | 00 | 01 | 02 | 10 | 11 | 12 |
| 01 | 01 | 02 | 00 | 11 | 12 | 10 |
| 02 | 02 | 00 | 01 | 12 | 10 | 11 |
| 10 | 10 | 11 | 12 | 00 | 01 | 02 |
| 11 | 11 | 12 | 10 | 01 | 02 | 00 |
| 12 | 12 | 10 | 11 | 02 | 00 | 01 |

Its proper subgroups are $Z_{2}=\{00,10\}$ and $Z_{3}=\{00,01,02\}$. Its subgroup lattice is given in figure(i):

Figure (i): Subgroup lattice of $\mathrm{Z}_{6}$
Take $\mathrm{L}=\mathrm{D}_{2} \mathrm{XD}_{2}$

Figure (ii):The product lattice $\mathrm{L}=\mathrm{D}_{2} \mathrm{XD}_{2}$

Define $\mathrm{A}: \mathrm{Z}_{6} \mathrm{~L}$ by $\mathrm{A}(00)=11, \mathrm{~A}(10)=01, \mathrm{~A}(01)$ $=\mathrm{A}(02)=10, \mathrm{~A}(11)=\mathrm{A}(12)=00$. This is an L-Fuzzy group and $D_{2} \times D_{2}$ is the maximum lattice for $Z_{2} \times Z_{3}=Z_{6}$.
4.22. Example. $\mathrm{Z}_{30}=\mathrm{Z}_{2} \mathrm{XZ}_{3} \mathrm{XZ}_{5}=\{0,1\}$
$X\{0,1,2\} X\{0,1,2,3,4\}=\{000,001$, $\qquad$ 123, 124\}. It has eight subgroups having 1 element, 2elements, 3 elements, 5 elements, 6 elements, 10 elements, 15 elements and 30elements respectively.They are
$\{e\}=\{000\}$,
$B=\{000,100\}$,
$\mathrm{C}=\{000,010,020\}$,
$\mathrm{D}=\{000,001,002,003,004\}$,
$E=\{000,010,020,100,110,120\}$,
$\mathrm{F}=\{000,001,002,003,004,100,101,102,103,104\}$, $\mathrm{G}=\{000,010,020,001,011,021,002,012,022,003$, $013,023,004,014,024\}$ and
$Z_{30}=\{000,001,002,003,004,010,011,012,013$, $014,020,021,022,023,024,100,101,102$, $103,104,110111,112,113,114,120,121,122$, $123,124\}$
The subgroup lattice can be found to be $D_{30}$.

Figure (iii): Subgroup lattice for $Z_{30}$

Take $L=D_{30}=D_{2} X D_{2} X D_{2}=\{0,1\} X\{0,1\} X\{0,1\}$ :

Figure (iv): Product lattice $\mathrm{D}_{2} \mathrm{XD}_{2} \mathrm{XD}_{2}$

The L-fuzzy subgroup $\mathrm{A}: \mathrm{Z}_{6} \mathrm{~L}$ is defined as follows:
$A(x)=(1,1,1)$ if $x \in\{e\}=\{000\}$
$A(x)=(1,1,0)$ if $x \in B-\{e\}=\{100\}$
$A(x)=(1,0,1)$ if $x \in C-\{e\}=\{010,020\}$
$A(x)=(0,1,1)$ if $x \in D-\{e\}=\{001,002,003,004\}$
$A(x)=(1,0,0)$ if $x \in E-(B C)=\{110,120\}$
$A(x)=(0,1,0)$ if $x \in F-(B D)=\{101,102,103,104\}$
$A(x)=(0,1,0)$ if $x \in G-(C D)=\{011,021,012,022,013$, $023,014,024\}$
$\mathrm{A}(\mathrm{x})=(0,0,0)$ if $\mathrm{x} \in\{111,112,113,114,121,122,123,124\}$
This shows that the maximum lattice for $\mathrm{Z}_{30}=\mathrm{D}_{30}$.

## 5. Concluding remarks

Since any finite cyclic group is isomorphic to $\mathrm{Z}_{\mathrm{n}}$ for some n and any n can be factored in the form $\mathrm{n}=p_{1}{ }^{n_{1}} p_{2}{ }^{n_{2}} \ldots \ldots . p_{r}{ }^{n_{r}}$, where $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots . \mathrm{p}_{\mathrm{r}}$ are distinct prime numbers, the technique described above can be applied to find the maximum lattice of any finite cyclic group. The
method can also be extended to infinite cyclic groups and this is the subject matter of another paper to be communicated soon.
